

Connectwise Automate API Requirements

Stellar Cyber Integration - 2025/02/27

Overview

Stellar Cyber has the ability to generate a Connectwise Manage ticket by means of API. This is accomplished through an integration script package provided by Stellar Cyber that will run on an external system and is invoked by the Stellar Cyber DP over an SSH channel.

UPDATE: Newer versions of this script will utilize the Stellar Cyber APIs to pull cases, along with case summary, observables, score, and a list of associated alerts. These are then organized into a friendly message format and used to open a ticket within Connectwise.

The following is a summary of all configuration items. These are explained in more detail in the following sections.

Parameter Name	Required
Connectwise URL	Yes
Company_ID	Yes
Public Key	Yes
Private Key	Yes
Client ID	Yes
Company Name Fallback	Yes
Company Map Mapping	
Default Board Name	Yes
Summary Prefix	
Status	
SLA	

Connectwise Automate API Requirements

Connectwise API Requirements

The integration script requires the following Connectwise API credentials:

- **Connectwise server URI (e.g.: na.connectwise.net)**
- **Company_id**
- **Public_key**
- **Private_key**
- **Client_id**

The following direction can be used to generate the credentials.

1. Within the “Manage” interface - **create a new API member**

The screenshot shows the Connectwise Manage interface. The left sidebar contains a list of navigation items: Manage, My Favorites, Companies, Sales, Marketing, Procurement, Project, Service Desk, Time & Expense, Finance, System, Setup Tables, My Company, Security Roles, Members, Mass Maintenance, and Report Writer. Red arrows point to 'System' and 'Members'. The main content area is titled 'Members - API Members > Detail' and shows licensing information: 'Regular (4 active/99 licensed), Mobile (0 active/100 licensed), StreamlineIT (0 active), Subcontractor(0 active)'. Below this are tabs for 'Regular', 'StreamlineIT', 'Subcontractors', 'API Members' (selected), 'API Keys', and 'API Callbacks'. A red arrow points to the 'API Members' tab. Below the tabs is a table with columns: Member ID, Member Name, Location, Role ID, and Inactive. The table contains four rows: 'labtech' (LabTech Software, Tampa Office, Admin), 'StellarAPI2' (Stellar API, Tampa Office, Admin), 'quosal' (Quosal API, Clearwater Office, Inactive), and 'screenconnect' (ScreenConnect API, Clearwater Office, Inactive). Red text 'create new API member' is overlaid on the right side of the screenshot.

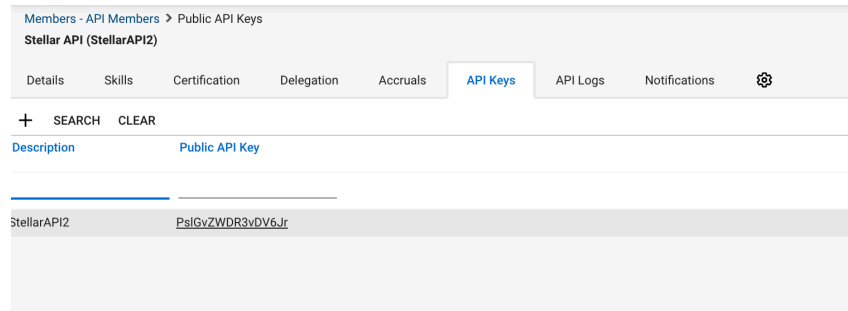

Member ID	Member Name	Location	Role ID	Inactive
labtech	LabTech Software	Tampa Office	Admin	
StellarAPI2	Stellar API	Tampa Office	Admin	
quosal	Quosal API	Clearwater Office		✓
screenconnect	ScreenConnect API	Clearwater Office		✓

2. Create API Keys for the member

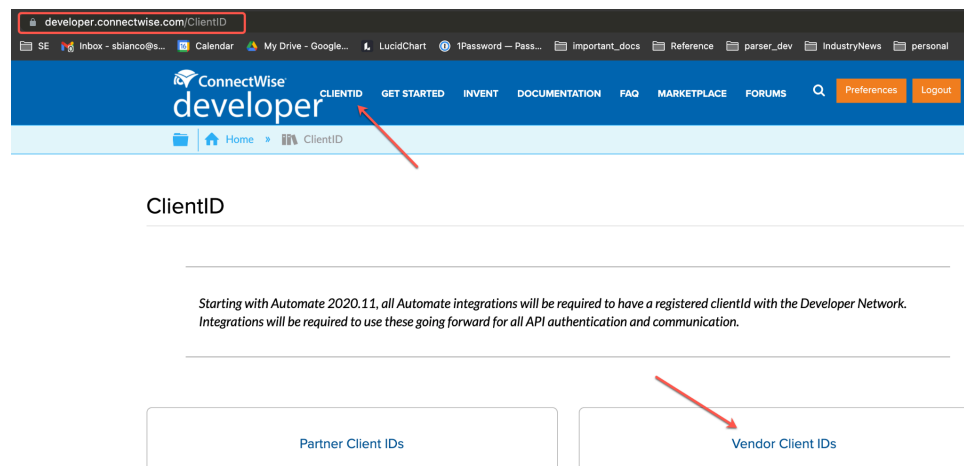

- Edit the new member by clicking on the member name in the list
- Navigate to the API keys tab

- Generate a new key pair (public/private) and record them
Note: the private key is only available during this step

3. A Client_ID is needed for API integration and is generated using developer resources

- Navigate to “developer.connectwise.com” and select “ClientID” and then “Vendor Client IDs”

- Request a client id
- The new client ID should arrive by email and is needed for integration

4. Provide the Stellar Engineer with:

- Connectwise server URI (e.g.: na.connectiwse.net)**
- Company_id**
- Public_key**
- Private_key**
- Client_id**

Connectwise API Permissions

The following are the *minimal* API permissions required for ticket integration and are obtained by navigating to:

- **configuration -> system -> manage security roles**

Category	Item	Add	Edit	Delete	Inquire
Service Desk	Service Tickets	My	My	None	My
Companies	Company Maintenance	None	None	None	All
System	Table Setup	None	None	None	All

Connectwise Ticket Requirements

The Stellar Cyber integration has several required parameters that will be passed to the Connectwise create ticket API.

- **Company Name**
The Stellar Cyber *Tenant Name* is used as the Connectwise *Company Name*. In the case that the Stellar Cyber tenant name does not correspond to a Connectwise company name, a mapping between tenant name and company name is contained in the Stellar Cyber integration configuration file.
- **Board Name**
The preferred Connectwise ticket board name is passed as a parameter. A default board name is also configured in the case of no match.
- **Summary Prefix**
This is an optional configuration setting that will use the configured string to prepend the ticket name. For example, if the configured string is "Stellar Security Alert: ", the resulting ticket title would be created as: "Stellar Security Alert: Uncommon Process Anomaly".
- **Status**
This is an optional configuration setting that defaults to "New". If a custom status is used, it must be created within the appropriate Connectwise board.
- **SLA**
These are optional settings and can be used to select a defined priority within the Connectwise ticket based on the event_score of the Stellar Cyber Security Alert.

Self-hosting Specifications

The integration script can run with minimal resources:

- 2 core
- 4 GB RAM
- 40 GB disk
- Python3.9 or greater
- Internet access for calling the Connectwise APIs
- Network access for calling the Stellar Cyber Platform APIs (or internet if SaaS or cloud)
